

The project parameters are as follows:

1. Team size: 2 students.
2. Hardware platform:
 - a. Wemos R32
 - b. Raspberry Pi Pico + display
 - c. RS485-to-serial converter (2 pcs)
3. The Wemos R32 module hosts a web page where data to be sent via the serial port can be entered. The page should include a button that allows the CRC checksum to be calculated. A second button should enable sending the data via a wired connection to the Raspberry Pi Pico module. Before sending, the user should be able to modify the message being transmitted.
4. The Raspberry Pi Pico module receives the message from the Wemos R32 module and verifies its correctness. If the CRC checksum is correct, it should be displayed on the screen. Otherwise, a "transmission error" message should be shown.
5. Wired connection – RS-485 interface.
